EVALUATION SUBJECT:

EPICORE, ER2R, ER2RA, ER3.5, AND ER3.5A STEEL DECK PANELS

1.0 EVALUATION SCOPE**Compliance with the following code:**2012, 2009, and 2006 *International Building Code®* (IBC)**Property evaluated:**

Structural

2.0 USES

The EPIC Metals steel deck panels are used in floor and roof decks, horizontal diaphragms, and composite floor and roof assemblies to support the code-required appropriate floor and roof loads.

3.0 DESCRIPTION

Epicore, ER2R, ER2RA, ER3.5, and ER3.5A steel deck panels are cold-formed from steel conforming to ASTM A653 SS Grade 40, with a minimum G60 galvanization coating designation. The panels are made from No. 14, 16, 18, 19, 20 or 22 gage steel [base-metal thicknesses of 0.0747, 0.0600, 0.0474, 0.0418, 0.0358 or 0.0295 inch (1.88, 1.52, 1.20, 1.06, 0.91 or 0.75 mm), respectively]. The panel profiles are as indicated in Figures 1 and 2 of this report. Panel descriptions are as follows:

1. Epicore: 2-inch-deep (51 mm) floor deck panel with embossments in the top flange for use in composite floor applications.
2. ER2R: 2-inch-deep (51 mm) nonacoustic roof deck panel.
3. ER2RA: 2-inch-deep (51 mm) acoustic roof deck panel with perforations in the bottom flanges for acoustical purposes.
4. ER3.5: 3.5-inch-deep (89 mm) nonacoustic roof deck panel.

5. ER3.5A: 3.5-inch-deep (89 mm) acoustic roof deck panel with perforations in the bottom flanges for acoustical purposes.

4.0 DESIGN AND INSTALLATION**4.1 General:**

The section properties and allowable load tables for the panels in this report have been established using the design base-metal thicknesses of the panels noted in Table 1. Allowable gravity and wind uplift loads must be based on section properties shown in Table 1. Allowable reactions based on web crippling must not exceed values shown in Table 7. The minimum concentrated live loads of IBC Section 1607 must be considered by the design professional based on the specific occupancy or use, as applicable.

4.2 Composite Decks with Vertical Load:

Epicore deck panels' maximum unshored spans and allowable superimposed uniform live loads for composite decks with various thicknesses of concrete are set forth in Tables 2, 3, 4, and 5, respectively. The concrete fill must comply with the applicable code, utilize normal weight and have a minimum compressive strength of 3000 psi (20.68 MPa). The decking must be clean and free of foreign materials prior to placement of concrete.

4.3 Bare (Non-Composite) Decks with Vertical Load:

The ER2R, ER2RA, ER3.5, and ER3.5A panels' allowable uniform loads (dead plus live) are shown in Table 6.

4.4 Diaphragm Design:

4.4.1 General: The one-third stress increase permitted for Allowable Stress Design, for load combinations in IBC Section 1605.3.2 including wind or seismic forces, must not be used for shear values in the diaphragm tables.

The horizontal diaphragm ASD shear and flexibility factors for the ER2R ER2RA, ER3.5, and ER3.5A decks are shown in Tables 8a, 8b, 8c, and 8d. Typical steel deck diaphragm layouts are shown in Figures 7. End weld patterns for the various decks are shown in Figures 3 and 4.

All welding must be accomplished with a minimum $\frac{1}{8}$ -inch-diameter (3.2 mm) E60XX or E70XX filler metal rod complying with the appropriate AWS standard. Other weld requirements must conform to AWS D 1.3. Arc seam welds or fillet welds of deck side laps must comply with requirements shown in Figures 5a and 5b. Arc spot (puddle) welds to supporting members must comply with requirements shown in Figure 6.

4.4.2 Diaphragm Design Considerations: The diaphragm design must include the following considerations:

1. Diaphragm classification (flexible or rigid) must comply with Section 1602 of the IBC; the diaphragm deflection (Δ) must be calculated using the equation noted in Table 9 of this report.
2. Diaphragm flexibility limitations must comply with Table 9.
3. Diaphragm deflection limits must comply with Sections 12.10.1 or 12.12.2 of ASCE 7.
4. Horizontal shears must be distributed in accordance with Section 12.8.4 of ASCE 7.

4.5 Installation:

The deck panels must be installed in accordance with this report and the EPIC Metals Corporation published installation instructions. If there is a conflict between this report and the published installation instructions, this report governs.

5.0 CONDITIONS OF USE

The Epicore, ER2R, ER2RA, ER3.5, and ER3.5A steel deck panels described in this report comply with, or are suitable alternatives to what is specified in, the code indicated in Section 1.0 of this report, subject to the following conditions:

- 5.1 Concrete-filled composite deck panels must not be used for loads that are predominantly vibratory, such as for operation of heavy machinery, reciprocating motors and moving loads.
- 5.2 Vertical load design of deck panels without a concrete fill must be based on section properties and web crippling values set forth in this report. Vertical load capacity of concrete-filled, composite deck systems must be as set forth in the tables in this evaluation report.
- 5.3 Special inspections must be provided in accordance with Chapter 17 of the IBC.

5.4 Where use is as a diaphragm:

5.4.1 The one-third stress increase permitted for Allowable Stress Design, for load combinations noted in IBC Section 1605.3.2 including wind or seismic forces, must not be applied to shear values in the diaphragm tables.

5.4.2 Allowable shear values must be limited to values set forth in the tables of this report for the types of deck panels involved.

5.4.3 Diaphragm deflections must not exceed the permitted relative deflections of walls between the diaphragm level and the floor below. See Table 9 for diaphragm flexibility and deflection limitations.

5.5 Calculations and details demonstrating that the loads applied to the deck panels comply with this report must be submitted to the code official for approval. Calculations must be prepared, signed, and sealed by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.

5.6 The minimum base-metal thickness of the steel deck panels must be 95 percent of the base-metal thickness noted in this report.

5.7 When the steel deck panels are used in a roof assembly, the panels must be covered with a code-complying roof covering.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Steel Deck Roof and Floor Systems (AC43), dated October 2010 (editorially revised September 2013).

7.0 IDENTIFICATION

The deck panels bear a label with the Epic Metals Corporation name and address, the job number, the deck panel type, the minimum base-metal thickness and yield strength, and the ICC-ES evaluation report number (ESR-2047).

For **SI**: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 psf = 4.88 kg/m², 1 psi = 6.89 kPa, 1 pcf = 16.02 kg/m³

¹Runways and planking must be used for all concrete placement.

²Slab weights are approximate, +/- 2 psf, and include deck weight.

³Applies to normal-weight concrete (145 pcf) with a minimum compressive strength, f'_c, of 3,000 psi.

⁴Minimum bearing length must be 2 inches at end supports and 4 inches at interior supports.

⁵Construction live loads: Uniform= 20 psf; Concentrated= 150 lbf per ft. width.

⁶Values based on LRFD.

⁷Overall slab depth refers to the nominal concrete depth measured from the top of the concrete to the bottom of the steel deck.

TABLE 3—EPICORE DESIGN UNFACTORED SUPERIMPOSED UNIFORM LIVE LOADS (psf)^{1,2,3,4}

FOR SIMPLE SPAN CONDITION

 $f_y = 40 \text{ ksi}$, Normal Weight Concrete (145 pcf) $f'_c = 3 \text{ ksi}$

For SI: 1 ksi = 6.89 MPa, 1 pcf = 16.0 kg/m³, 1 psf = 0.0479 kN/m², 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 in²/foot = 59.27 mm²/m¹The maximum unshored span for the panels is shown in Table 2.²All loads are assumed to be statically applied.³Deflection limit of the composite slab is $\frac{1}{360}$ of span under total load, which includes live load (as shown in Table), and dead load (weight of reinforced concrete and weight of the steel deck).⁴Longitudinal and transverse reinforcement bars having a yield strength of at least 60 ksi or welded wire fabric must be provided. Area of this reinforcement must be equal to 0.00075 times the area of concrete above the steel deck but not less than 0.028 square inch per foot of width.⁵Overall slab depth refers to the nominal concrete depth measured from the top of the concrete to the bottom of the steel deck.

¹Loads are based on ASD Design.²Uniform load values listed on the left side of the box are governed by stress or web crippling and the values listed on the right side of the box are governed by deflection.³The deflection criteria used for generating the tables above are L/240 or 1" maximum.⁴Stress governed values assume a maximum allowable stress of 24 ksi.⁵Minimum end and interior support bearing lengths are 2" and 4", respectively.

For SI: 1 inch = 25.4 mm, 1 plf = 14.6 N/m

FOOTNOTES FOR TABLES 8a through 8d—ALLOWABLE DIAPHRAGM SHEAR AND FLEXIBILITY NOTES

¹ F = Flexibility factor is the distance measured in average micro-inches a diaphragm web will deflect in a span of 1 foot under a shear of 1 pound per foot.

q_D = Allowable diaphragm shear, in pounds per linear foot.

R = Ratio of vertical load span of the deck to length of each deck sheet.

² Arc Seam or spot (puddle) weld end-weld patterns are shown in Figures 3 and 4.

³ The one-third stress increase must not be permitted for resistance to horizontal forces due to earthquake or wind.

⁴ See Table 9 for diaphragm flexibility limitations and the footnotes to Table 9 for guidance on diaphragm deflection computations.

⁵ Arc seam or spot (puddle) welds must have an effective fusion area to supporting members at least equivalent to a $3/8" \times 1"$ long (arc seam welds) or $1/2"$ diameter (spot-puddle weld), respectively.

⁷ Spacing of marginal welds to members parallel to flutes:

a. Arc seam or spot (puddle welds to members such as chords and to collector elements such as struts or ties must have a spacing in feet equal to $32,000(t)/v$:

where:

t = Uncoated base-metal thickness of fluted deck, in inches.

v = Actual diaphragm shear at marginal supports parallel to flutes or actual shear to be transferred to collector elements (at struts or ties), in pounds per foot

b. The spacing of welds parallel to flutes must not exceed the deck span divided by three.

⁸ Attachments at interior lines of shear transfer perpendicular to deck corrugation:

- The shear transfer from a diaphragm to interior tie or strut lines perpendicular to deck corrugations must not exceed the shear values indicated in the tables.

- Two lines of puddle welds may be used to develop the actual shear transfer of these collector elements.

⁹ Where individual panels are cut, the partial panel must be fastened to ensure complete transfer of design shear forces at the point of the diaphragm to adjacent full panels to attain the values specified in the tables.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 lbf / ft = 14.6 N/m

TABLE 9—DIAPHRAGM FLEXIBILITY LIMITATIONS^{1,2,3,4,5}

| FLEXIBILITY FACTOR, F ³ | MAXIMUM SPAN FOR MASONRY OR CONCRETE WALLS (feet) | SPAN / DEPTH LIMITATION | | | |
|------------------------------------|---|--|-----------------------------|----------------------------------|-----------------------------|
| | | Rotation Not Considered in Diaphragm | | Rotation Considered in Diaphragm | |
| | | Masonry or Concrete Walls | Flexible Walls ⁴ | Masonry or Concrete Walls | Flexible Walls ⁴ |
| Over 150 | Not used | Not used | 2 : 1 | Not used | 1 1/2 : 1 |
| 70 - 150 | 200 | 2:1, or as required for deflection | 3 : 1 | Not used | 2 : 1 |
| 10 - 70 | 400 | 2 1/2:1, or as required for deflection | 4 : 1 | As required for deflection | 2 1/2 : 1 |
| 1 - 10 | No limitation | 3:1, or as required for deflection | 5 : 1 | As required for deflection | 3 : 1 |
| Less than 1 | No limitation | As required for deflection | No limitation | As required for deflection | 3 1/2 : 1 |

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 psi = 6.89 kPa, 1 psf = 4.88 kg/m², 1 plf = 14.6 N/m

¹ Diaphragms are to be investigated regarding their flexibility and recommended span-depth limitations. Refer to Table 8 for determination of the value F.

² Diaphragms supporting masonry or concrete walls are to have their deflections limited to the following amount:

$$\Delta_{\text{wall}} = (H^2 / 0.01E_i) f_c$$

where:

E = Modulus of elasticity of wall material for deflection determination, in pounds per square inch.

f_c = Allowable compressive strength of wall material in flexure, in pounds per square inch.

For concrete, f_c = 0.45 f'_c

For masonry, f_c = F_b = 0.33 f'm

H = Unsupported height of wall, in feet.

t = Thickness of wall, in inches.

³ The total deflection, Δ, of the diaphragm may be computed from the equation:

$$\Delta = \Delta_f + \Delta_w$$

where:

Δ_f = Flexural deflection of the diaphragm determined in the same manner as the deflection of beams.

Δ_w = Web deflection determined by the equation:

$$\Delta_w = (q_{\text{avg}} L_1 F) / 10^6$$

where:

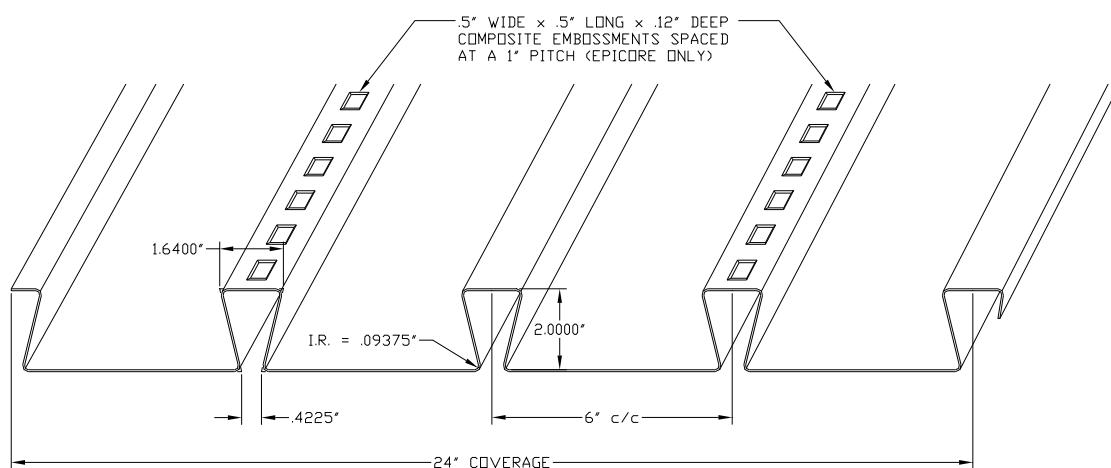

F = Flexibility factor (the average micro-inches a diaphragm web will deflect in a span of 1 foot under a shear of 1 pound per foot).

L₁ = Distance between vertical resisting element (such as shear wall) and the point to which the deflection is to be determined, in feet.

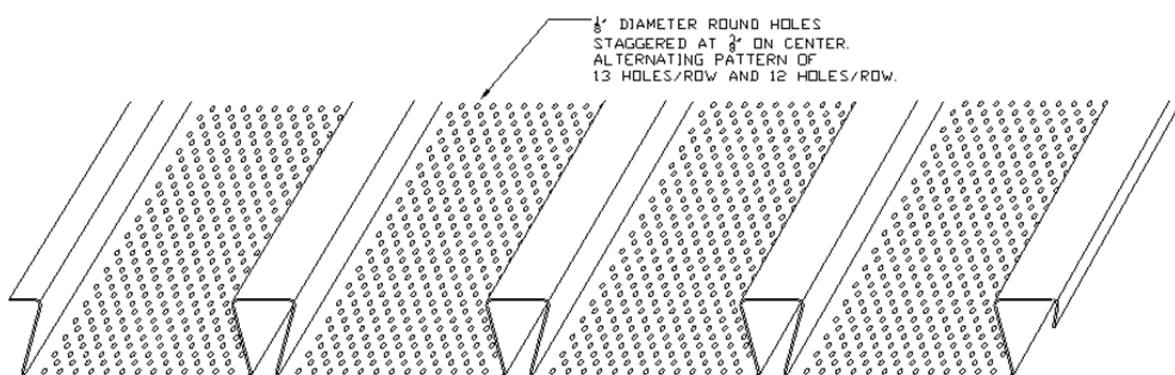

q_{avg} = Average shear in diaphragm., in pounds per square foot, over length L₁.

⁴ When applying these limitations to cantilevered diaphragms, the allowable span-depth ratio will be half that shown.

⁵ Diaphragm classification (flexible or rigid) and deflection limits must comply with Section 4.3.2 of the report.

EVALUATION SUBJECT:**EPICORE, ER2R, ER2RA, ER3.5 AND ER3.5A STEEL DECK PANELS****1.0 REPORT PURPOSE AND SCOPE****Purpose:**

The purpose of this evaluation report supplement is to indicate that EPICORE, ER2R, ER2RA, ER3.5 and ER3.5A steel deck panels, recognized in ICC-ES master evaluation report ESR-2047, have also been evaluated for compliance with Chapters 22 and 22A of the code noted below.

Applicable code edition:

2013 California Building Code (CBC)

2.0 CONCLUSIONS

The EPICORE, ER2R, ER2RA, ER3.5 and ER3.5A steel deck panels, described in Sections 2.0 through 7.0 of the master evaluation report ESR-2047, comply with CBC Chapters 22 and 22A, provided the design and installation are in accordance with the 2012 *International Building Code*® (IBC) provisions noted in the master report and the additional requirements of the CBC Chapters 16, 16A, 17, 17A, 22 and 22A, as applicable.

This supplement expires concurrently with the master report, reissued July 2015.
